

How much does a 10kW external rack for a data center user in Vietnam cost

Overview

How much does it cost to power a data center?

With this information, the calculator can determine that your power density is 12.6 kW per rack and that it costs \$13,245 annually to power each rack at 100% usage. In your data center of 500 racks, that amounts to over \$6.6 million in total annual data center energy consumption costs. This information alone is useful.

How much power does a 500-rack data center use?

The calculator determines that, in this 500-rack data center with a power density of 12.6 kW per rack, if you are stranding 40% of our power, then that is 5.04 kW per rack or 2,520 kW across the entire data center. It also tells us that this amounts to 200 racks' worth of power.

What percentage of data centers have less than 10kW racks?

It's important to note that 37 percent of data centers still have racks of less than 10kW. There are three key reasons why these data centers have not seen substantial increases in rack density. Server virtualization has been around for decades, and containerization has been used for several years.

Why does a data center rack use a lot of power?

IT equipment consumes a lot of power when performing calculations and processing data. At the same time, it emits too much heat, which can lead to multiple problems. Energy supply and data center cooling are interconnected since the data center rack's power consumption level depends on the data center's climatic conditions.
